

IBM AS400 / iSeries Hosting Increase efficiency and reduce operating costs

Essextec provides specialized implementation, colocation, hosting, and management services for IBM i Power Systems. These services increase efficiency and reduce costs associated with operating IBM systems. Additionally, IBM i services offer a unique and cost effective approach to corporate operations and business continuity requirements.

Essextec, a Certified IBM Delivery Partner

As a certified IBM Delivery Partner with over two decades of experience and several strategic partnerships, Essextec provides industry leading levels of security, redundancy, bandwidth, and expertise for IBM i systems.

Services include:

- > IBM Power 8 Systems Unlimited CPW, memory, and storage for hosted LPAR Solutions
- > Fully managed operating system instances
- > 24/7/365 expert support with trained technicians
- > Remote management services for housed and off site equipment
- > Various replication and HA product support (*i.e.*, Maxava High Availability Suite, Vision Solutions Suite, and IBM iCluster and Transformation server products)
- > Fully certified, redundant, SSAE 16 facilities, vendor neutral and unlimited bandwidth

3 Ways CIOs can Increase Production and IBM Power System High Availability

As any CIO or head of IT knows, IBM Power System (i) uptime directly affects production performance. Staying up to date with modern technology advancements provide companies with needed tools in order to be increasingly profitable, automated, and competitive in the global market. Maximizing IBM Power System (i) resources enables the full potential of production capacity, while also protecting against disasters, unscheduled system downtimes, and cybersecurity breaches.

1

Utilize IBM Power System (i) existing features to increase efficiency

IBM Power System (i) has been specially designed to manage all complex relational database operations. It distributes the balance of data across all system storage, using as little space possible. IBM Power System (i) also has the ability to run multiple applications alongside one another, keeping them as separate or as integrated as the user desires.

2

Get cloud stabilized and redundant - 24/7 high availability

The movement from local to cloud solutions has been wholly embraced by companies over the last decade. Companies around the world have reaped the rewards of increased speed, high availability, security, and coordination between different locations of company sites. It has proven tempting for many CIOs to keep their servers in house. However, according to a recent Bain Brief, *Tapping Cloud's Full Potential*, public cloud servers run by specialized tech companies such as IBM, Amazon, Google, and Microsoft consistently deliver a safer and more reliable standard of security. Tech companies are generally quicker to adapt to developments in the field, automatically working to keep your company servers protected.

3

Leverage the right IBM Power System (i) support vendor

While IBM Power System (i) can be hosted on the cloud and offer server security, a certified IBM Power System (i) support vendor can help unlock a system's full potential and increase capabilities across the board. While many may believe a system is operating optimally, a certified IBM Power System (i) expert continually monitors and adjusts the system and can dramatically increase uptime, high availability, and performance.

The Bottom Line

Finding the right certified IBM Power System business partner is one of the best ways to ensure that your operations run smoothly and that your production line produces at its optimal potential.
